## Assignment - 13

Bathish Kumar  
32191030403

① What is dictionary in Python? Explain with example.

Ans:- A dictionary is a collection which is unordered, changeable and indexed. In Python dictionaries are written with curly brackets and they have keys and values.

Ex:- Dict = dict()

dict() method helps to create a dictionary.

Dict = {1: "Bathish", 2: "Kumar", 3: "HS"}

Here, 1, 2, 3 are key with their respective values.

② What are tuple? Explain with example.

Ans:- A tuple is a collection which is ordered and unchangeable. In Python tuple are written with round brackets.

Ex:- Tuple = ("apple", 1, 1.43)

Tuple contains values in its indexes (0 - n-1). They are similar to list.
